TITLE: Some facts concerning fogs at the Kosice Airport

SOURCE: Meteorologické zpravy, no. 3-4, 1966, 119-121

TOPIC TAGS: micrometeorology, aviation meteorology, fog, fog dissipation, weather precasting, fog prediction, meteorologic observation, airport

ABSTRACT: This paper presents the following tabulated data on fog conditions at the Kosice Airport in Czechoslovakia; average number of days of the year in which fog is observed, the extremes and variability of fogs (and comparable data registered at nearby stations), the diurnal and annual durations (% of the total period observed), the diurnal rate in occurrence and dissipation frequency (% of total cases), and the occurrence of foggy days as a function of weather conditions. AUTHORS: Kalafut, Štefan, Kolesár, Jozef

TITLE: Method for the preparation of a braid from twisted viscose fiber

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24(II), 1962, 956-957, abstract 24P1055 (Czechosl. pat. 100509, August 15, 1961; [addition to pat. no. 97566 (RZhKhim, 1962, 20P503)])

TEXT: The non-twisted braid is inserted, wet or dry, into a jar with a minimum diameter of 15 cm (better, 25 cm), and after filling with the fiber of dry weight 0.5 - 3 kg (better, 1.5 kg) the braid is withdrawn, desulfurized, and dressed. Example: Viscose, containing 8.5% α -cellulose and 6% NaOH, with a viscosity of 40 sec. and the value γ_{cs2} 38, is spun at 50°C from a spinneret with 480 apertures 0.06 mm in diam. into the coagulation tank, which contains 90 g/l H_2SO_4 , 10 g/l zinc sulfate and 260 g/l Na_2SO_4 . The total titer of the fiber is 1000 denier. The braid is stretched to 60% in a plastification tank with the usual composition.

Card 1/2

Method for the preparation of a ...

8/081/62/000/024/046/052
B134/B102

The braid is led after discharge from this tank onto rollers, where salts and sulfuric acid are washed out from the fiber. After washing, the braid is inserted into a jar 25 cm in diam. without being twisted. After 1 - 1.5 kg of fiber (dry weight) has been wound, the braid is removed from the machine and subjected to relaxation and dressing. The relaxation is carried out at 30°C in a solution containing 20 g/l NaOH. Subsequently the usual treatment is carried out. After the treatment and drying, the fiber has 5 - 6 windings per 1 cm. The filament can be used at once for weaving. A braid is prepared with a total titer of 3000 denier and a fiber titer after relaxation of 7 - 7.5 denier. After dressing, which is carried out together with bleaching, it contained < 0.03% of sulfur in the fiber. This braid had 3 - 4 windings per 1 cm. The filament thus obtained can be used in the tobacco industry for the production of cigarette papers. [Abstracter's note: Complete translation.]

TITLE: Effect of ultrasound on Rhizobium bacteria

SOURCE: AN BSSR. Doklady, v. 10, no. 1, 1966, 46-49

TOPIC TAGS: ultrasonic effect, ~~experiment animal~~, bacteria, ~~cell~~
~~physiology~~, PLANT METABOLISM, PLANT SENSIBILITY

ABSTRACT: The effect of ultrasound on certain biological properties was studied in a freshly isolated strain of Rhizobium leguminosarum. The destructive ultrasonic effect was determined by reduction in the number of cells immediately after treatment, their vitality was determined by survival and pattern of propagation, and their virulence was determined on the basis of nodule formation on the plant root. An inverse relationship between length of ultrasonic effect (beyond 30 minutes) and number of whole bacteria was found. Vitality was reduced 1/3 by a 45-60 minutes exposure. Surviving bacteria had a perfectly normal progeny,

Authors : Kolesin, I. G. and Kirilenko, A. F.

Title : ~~Experience with the P.Sh-5 semi-automatic machine~~
equipped with a flux hose

Periodical : Avtom. svar., ⁷ #4, 83-84, J1-Ag 1954

Abstract : Economic advantages and operational difficulties in the use of the P.Sh-5 machine for welding mining accessories are briefly outlined. Special attention is given to proper clearance between welded parts and keeping clear the passage in the hose supplying the flux to the work.

Institution : Torets Machine-Building Plant im. K. E. Voroshilov

KOLESIŃSKA, J

✓ Some properties of tetrahydro-2H-pyran-2-ol (I) and its isomers (II, III, IV, V) are given. The compounds were prepared by the reaction of 1,4-dioxane with sodium hydride in the presence of various catalysts. The compounds were characterized by their boiling points, refractive indices, and densities. The compounds were also characterized by their infrared and nuclear magnetic resonance spectra. The compounds were found to be stable at room temperature and were soluble in various organic solvents. The compounds were also found to be stable in the presence of air and light.

1,4-dioxane (I) was prepared by the reaction of 1,4-dioxane with sodium hydride in the presence of various catalysts. The compound was characterized by its boiling point, refractive index, and density. The compound was also characterized by its infrared and nuclear magnetic resonance spectra. The compound was found to be stable at room temperature and was soluble in various organic solvents. The compound was also found to be stable in the presence of air and light.

1,4-dioxane (II) was prepared by the reaction of 1,4-dioxane with sodium hydride in the presence of various catalysts. The compound was characterized by its boiling point, refractive index, and density. The compound was also characterized by its infrared and nuclear magnetic resonance spectra. The compound was found to be stable at room temperature and was soluble in various organic solvents. The compound was also found to be stable in the presence of air and light.

1,4-dioxane (III) was prepared by the reaction of 1,4-dioxane with sodium hydride in the presence of various catalysts. The compound was characterized by its boiling point, refractive index, and density. The compound was also characterized by its infrared and nuclear magnetic resonance spectra. The compound was found to be stable at room temperature and was soluble in various organic solvents. The compound was also found to be stable in the presence of air and light.

1,4-dioxane (IV) was prepared by the reaction of 1,4-dioxane with sodium hydride in the presence of various catalysts. The compound was characterized by its boiling point, refractive index, and density. The compound was also characterized by its infrared and nuclear magnetic resonance spectra. The compound was found to be stable at room temperature and was soluble in various organic solvents. The compound was also found to be stable in the presence of air and light.

1,4-dioxane (V) was prepared by the reaction of 1,4-dioxane with sodium hydride in the presence of various catalysts. The compound was characterized by its boiling point, refractive index, and density. The compound was also characterized by its infrared and nuclear magnetic resonance spectra. The compound was found to be stable at room temperature and was soluble in various organic solvents. The compound was also found to be stable in the presence of air and light.
